

# Dichomeris ligulella Palmerworm Moth

FAMILY: Gelechiidae SUBFAMILY: Dichomerinae TRIBE: [Dichomeridini]  
 TAXONOMIC\_COMMENTS:

FIELD GUIDE DESCRIPTIONS: Covell (1984); Beadle and Leckie (2012)

ONLINE PHOTOS:

TECHNICAL DESCRIPTION, ADULTS: Hodges (1986)

TECHNICAL DESCRIPTION, IMMATURE STAGES: Chapman and Lienk (1971)

ID COMMENTS: *Dichomeris ligulella* is rather easily recognized by its color patterning, elongated and narrow wings, and labial palps with a prominent scale tuft and a slender, upright third segment that curves rearward and tapers to an acute apex. The adults have two color morphs that occur in both sexes. The first varies from rather uniformly light brown to light grayish, and has varying degrees of scattered darker flecking. The forewing of fresh specimens has four dark spots on the dorsal half of the wing that include a pair just before and beyond the middle. In the proximal pair the spot closest to the inner margin is slightly posterior to the other spot, while the reverse occurs for the distal pair beyond the middle. A row of dark spots is also present at the wing tip that begins in the subapical area and continues along the termen. The second color morph has a conspicuous dark brown to brownish-black longitudinal band that extends along the dorsal half from the wing base to the wing tip. The band tends to be somewhat jagged on the proximal half.

DISTRIBUTION: *Dichomeris ligulella* is a common species that is found throughout most of the eastern US and adjoining areas on southern Canada (Saskatchewan eastward to Nova Scotia). Isolated records are also known from British Columbia and Wyoming. In the eastern US the range extends from Maine to southern Florida, and westward to central Texas, central Oklahoma, eastern Kansas, eastern Nebraska, Minnesota, and northeastern North Dakota. This species occurs statewide in North Carolina, from barrier islands to higher elevation slopes in the Blue Ridge.

FLIGHT COMMENT: The adults have been found in every month of the year in different areas of the range. Populations in most areas appear to be univoltine, with the adults surviving in some cases for 9-10 months before breeding and laying eggs in the spring and early summer. As of 2023 we have records for all but the coldest months of the year, with the overwintering adults sometimes appearing at lights on warm winter nights.

HABITAT: Our records come from a wide range of hardwood-containing habitats, including maritime forests, bottomland forests, and mesic slopes. The majority come from semi-wooded residential neighborhoods.

FOOD: The larvae feed on a wide range of hardwood species (Chapman and Lienk, 1971; Craighead et al., 1950; Prentice, 1966; Covell, 1984; Hodges, 1986; Linit et al., 1986; Godfrey et al., 1987; Heppner, 2007; Robinson et al., 2010; Marquis et al., 2019). The reported hosts include Silver Maple (*Acer saccharinum*), Sugar Maple (*A. saccharum*), Paper Birch (*Betula papyrifera*), Shagbark Hickory (*Carya ovata*), American Chestnut (*Castanea dentata*), hackberries (*Celtis*), hazelnuts (*Corylus*), Quince (*Cydonia oblonga*), American Witch-hazel (*Hamamelis virginiana*), Black Walnut (*Juglans nigra*), Sweet Crabapple (*Malus coronaria*), Common Apple (*M. domestica*), Sourwood (*Oxydendrum arboreum*), Bigtooth Aspen (*Populus grandidentata*), Quaking Aspen (*P. tremuloides*), American Plum (*Prunus americana*), pears (*Pyrus*), White Oak (*Quercus alba*), Scarlet Oak (*Q. coccinea*), Shingle Oak (*Q. imbricaria*), Bur Oak (*Q. macrocarpa*), Chinquapin Oak (*Q. muehlenbergii*), Northern Red Oak (*Q. rubra*), Post Oak (*Q. stellata*), Black Oak (*Q. velutina*), *Rhododendron*, goldenrods (*Solidago*), American Basswood (*Tilia americana*) and Northern Highbush Blueberry (*Vaccinium corymbosum*).

OBSERVATION\_METHODS: The adults are attracted to lights. More information is needed on host use in North Carolina.

NATURAL HERITAGE PROGRAM RANKS: GNR S5

STATE PROTECTION: Has no legal protection, although permits are required to collect it on state parks and other public lands.

COMMENTS: This is a very common and widespread polyphagous species that appears to be secure within the state.
