

Sympetrum internum Cherry-faced Meadowhawk

High counts of:

Earliest date: ?
Latest date: ?

Status		Rank	
NC	US	NC	Global
W	-	SU	G5

DISTRIBUTION: This is a Northern and Midwestern species, ranging generally south to VA and KY. There is a report/record from Macon County listed in OdonataCentral. No data, other than coordinates, are provided. The range map as shown in Paulson (2011) does extend down into NC to include this area.

ABUNDANCE: Presumed very rare, if it truly occurs in NC.

FLIGHT: Probably June into September or October.

HABITAT: Marshy edges of lakes, ponds, and other open wet areas.

BEHAVIOR: Probably like other meadowhawks.

COMMENTS: It is very unfortunate that the report in OdonataCentral has no observer/photographer/collector name, no date, and no other information, to let readers know if the report is legitimate. However, the website does say that the record has been "vetted", thus approved by an expert. Nonetheless, all previous checklists for NC did not include this species; thus, it might be assumed that the report is recent (2005 or later). The N.C. Natural Heritage Program has added the species to its Watch List in 2012. If the data become available, as this species is not considered to be a migrant, it might be moved over to the Rare List.

NOTE: White-faced, Cherry-faced, and Ruby meadowhawks are very difficult to identify reliably from a single typical aspect photo. Whenever possible, clear closeup photographs of the male hamules or female subgenital plate should be provided.
